

Omics-based databases, web servers, or software frequently used in bioinformatics approaches to identify prospective target genes from natural compounds and plant-derived or traditional Chinese medicines (TCMs), as well as their impact on enhancing the effectiveness of conventional drugs when used in combination in the treatment of breast cancer across several subtypes.

Single natural compound or natural product derived from plant or traditional Chinese medicines	Breast cancer subtypes	Omics-based databases, web servers or software					References
		Data Mining	GO and KEGG pathway enrichment analysis	PPI network and hub gene selection	Genetic Alteration	Survival analysis
